Brainstorming and Idea Prioritization

Trip Planner — Supporting Project Document

Purpose

The brainstorming activity converts the broad idea of making travel easier into a small set of useful, related capabilities. The team considered what a traveller typically does before departure and identified repeated tasks that could be supported through one interface.

Ideas Considered

• Destination and attraction discovery

• Day-wise itinerary drafting

• Budget category estimation

• Packing checklist creation

• Saving and revisiting trip plans

• Live weather and route information

• Hotel, bus and train booking

• Payments and reservations

Selection Criteria

Ideas were compared by user value, technical feasibility, time required, external service dependency, and whether the result could be demonstrated reliably. The first five items form a coherent planning workflow; booking and payments were deferred because they require trusted providers, transaction security and more extensive testing.

Final Concept

Trip Planner collects trip preferences once and uses them to create an itinerary, a budget estimate and a packing checklist. The user can review the suggestions and save the complete plan. It is a planning assistant, not a guarantee of travel facts or bookings.

Expected Output

A prioritized feature list, scope boundary and explanation of why each selected feature supports the main user need.
