Define Problem Statements

Trip Planner — Supporting Project Document

Primary Problem

Planning a trip requires travellers to gather ideas, distribute activities across available days, estimate spending and remember essential items. These tasks are often handled in separate websites and notes, increasing effort and making the overall plan harder to review.

User Need

The user needs a simple starting plan based on destination, duration, group size, budget, travel style and interests. The result should be easy to scan and should help the user identify what needs further checking.

How Might We

How might we help a traveller create an organized first-draft plan from a few preferences, while keeping costs transparent as estimates and leaving final decisions with the traveller?

Scope

The current scope includes AI-generated planning text and saved trip records. Live booking, payments, verified availability and guaranteed prices are outside the confirmed scope.

Success Indicators

The user can submit preferences, receive the three expected output types, understand that the content needs review, and save/retrieve a trip.
