Customer Journey Map

Trip Planner — Supporting Project Document

Stage 1 — Start

The user opens the planner and needs to understand what information to enter. Clear labels and sensible defaults reduce hesitation.

Stage 2 — Provide Preferences

The user enters destination, duration, travellers, budget, style and interests. Validation should catch missing or invalid values before generation.

Stage 3 — Generate Plan

The user submits the form and waits for the AI response. A visible loading state and a helpful failure message make this step easier to understand.

Stage 4 — Review Outputs

The user reads the itinerary, estimated budget and packing checklist. Headings, readable spacing and separate result panels support scanning.

Stage 5 — Save and Return

The user saves the plan and expects confirmation. Retrieving the saved record later is the strongest practical check that persistence works.

Pain Points and Improvements

Slow responses, long text, inaccurate estimates and unclear save feedback can reduce trust. Suggested improvements include progress feedback, copy/export actions, editable plans and explicit estimates.
