Solution Requirements and Acceptance Criteria

Trip Planner — Supporting Project Document

Functional Requirements

• FR-01: Accept destination and trip preferences.

• FR-02: Generate a day-wise itinerary.

• FR-03: Generate an estimated budget breakdown.

• FR-04: Generate a packing checklist.

• FR-05: Render output in readable sections.

• FR-06: Save a completed trip.

• FR-07: Retrieve saved trips.

Non-functional Requirements

The interface should be understandable, backend errors should be handled safely, secrets should not enter frontend code, and setup should be repeatable from dependency files.

Acceptance Tests

For each requirement, define setup, input, action, expected result and actual result. Mark a test as passed only after observing the behavior.

Validation Rules

Destination should not be blank. Duration and traveller count should be positive integers. Budget should be a valid positive amount. The backend should repeat critical validation rather than relying only on the browser.

Out of Scope

Bookings, payments, live price guarantees and user accounts should be treated as future work unless separately implemented and tested.
