Problem–Solution Fit

Trip Planner — Supporting Project Document

Hypothesis

Travellers who enter basic preferences will find it useful to receive an itinerary draft, cost categories and packing reminders together, rather than assembling every item manually.

How the Solution Fits

The form gathers common constraints once. The generation workflow reuses those constraints for multiple outputs. Saving lets the user keep the plan for later review.

Evidence to Collect

Observe whether a user can complete the form without assistance, whether the result reflects entered interests, whether budget labels are clear, and whether saved trips can be found again.

Risks

Generated recommendations can be generic or incorrect. A combined interface reduces task switching but does not replace checking authoritative travel information.

Next Validation Step

Conduct short user trials with different destinations, durations and budgets. Record task completion issues and revise the form or result layout based on observed feedback.
