Proposed Solution

Trip Planner — Supporting Project Document

Overview

Trip Planner is a web-based assistant for preparing a first-draft travel plan. It combines preference entry, AI generation and saved-trip storage in one workflow.

Core Workflow

The traveller enters trip details, generates the itinerary, reviews budget estimates, checks packing suggestions and saves the complete plan.

Benefits

The application organizes several planning tasks together, offers a starting point for day-by-day activities and provides a reusable saved plan.

Responsible Use

The output should be reviewed by the traveller. Price estimates, venue details, transport suggestions and local recommendations are not guaranteed to be current or accurate.

Boundaries

The current concept does not imply integrated bookings, payments, verified availability or live price retrieval.
