Code Layout, Readability and Reusability

Trip Planner — Supporting Project Document

Repository Layout

Keep API code and Python dependencies inside backend/. Keep React source, package manifests, Vite configuration and static assets inside frontend/. Keep only source and safe configuration templates under version control.

Readability

Use descriptive names, consistent indentation, focused functions and comments for non-obvious decisions. Avoid enormous components that mix input handling, API calls, rendering and database behavior.

Reusability

Extract repeated UI patterns and request helpers where doing so reduces duplication. Keep AI prompt construction and database operations in clear backend functions.

Error Handling

Distinguish validation errors, AI provider failures and database errors. Do not silently show old output as if it were newly generated.

Git Hygiene

Exclude .env, .env.local, .venv, node_modules, caches, dist and personal backup files. Review git status and staged filenames before each commit.
