Functional Features Included in the Solution

Trip Planner — Supporting Project Document

Travel Preference Form

The form captures destination, duration in days, number of travellers, budget, travel style and interests. These values are used to personalize generated content.

Itinerary Generation

The itinerary organizes activity suggestions into days and time periods. Users should verify opening hours, distances, transport and venue details independently.

Budget Breakdown

The budget output groups likely expenses such as accommodation, food, local transport, activities and contingency. Values are estimates, not live quotes.

Packing Checklist

The packing output lists items to consider based on the destination and trip duration. The user should adapt it to season, planned activities, medical needs and baggage rules.

Save and Retrieve

The save flow stores the complete trip, and the saved-trip view should retrieve prior records. Persistence is best verified by reloading or requesting the record again.

Feature Boundary

The described features do not imply integrated booking, payment processing or guaranteed live information.
