Project Communication

Trip Planner — Supporting Project Document

Opening Explanation

Introduce the planning problem, the intended user and the way Trip Planner turns a small set of preferences into three useful planning outputs.

Feature Explanation

Explain itinerary suggestions, estimated budget categories and packing reminders in terms of the traveller's needs. Demonstrate the interface instead of reading technical details verbatim.

Technical Explanation

Describe the frontend, backend, AI provider and database as separate responsibilities. Explain that server-side configuration keeps credentials out of the browser.

Responsible Claims

Use terms such as 'AI-generated suggestions' and 'estimated cost'. Do not call outputs verified or guaranteed. State clearly if booking or payment integrations are not implemented.

Question Preparation

Prepare to explain data flow, save/retrieve behavior, external dependencies, security measures, limitations and future improvements.
