Scalability and Future Plan

Trip Planner — Supporting Project Document

Authentication and Ownership

Add user sign-in and associate each trip with its owner. Enforce access restrictions in backend logic and database row-level security.

Travel Data Integrations

Potential future services include weather, maps, route estimates and trusted price sources. Each integration should be assessed for licensing, API limits, cost and data freshness.

Bookings and Payments

Booking and payment functionality would require authorized providers, secure transaction handling, cancellation/refund rules and careful testing. It should not be represented as available in the current prototype.

Reliability

Add automated tests, health checks, structured logs, monitoring, bounded retries and clear error reporting.

User Experience

Possible improvements include editing generated plans, exporting to PDF, sharing trips, multilingual output and collaboration.

Prioritization

Prioritize security and reliability before adding complex integrations. Measure user feedback and operational performance to guide the roadmap.
